

INTERACTIVE WEB PAGE - EXPLANATION

I created a simple interactive webpage using HTML, CSS, and JavaScript.

Features added using JavaScript:

1. **Change greeting button** – When clicked, it shows a different friendly message every time (using an array and random selection).
2. **Random background colour button** – Changes the page background to a random light colour.
3. **Live click counter** – Every time you click the button, the number increases.

All JavaScript code is written inside the `<script>` tag at the bottom of the HTML file (embedded JavaScript).

I used onclick attribute on buttons to call JavaScript functions. This is the easiest way for beginners to add interactivity.

This assignment helped me understand how JavaScript can make a static webpage dynamic and fun.
